Changelog

Version 1.1 (July 18, 2026)

- Deployed a rebuilt, security-hardened staking contract at a new address (0xc84d7d602bB3880a1f5a83335c0C61c9C3e9c668), replacing the original staking contract.
- Fixed an unrestricted emergency-withdraw function that could have allowed withdrawal of staked user funds; withdrawals are now capped to the undistributed reward pool only.
- Fixed a reward-accounting bug where unstaking one token type (PHAND or LP) could zero out unclaimed rewards accrued on the other.
- Added partial unstaking (previously only full withdrawal was possible) and per-type (PHAND / LP) auto-claim toggles.
- Added a public view function to preview pending rewards without submitting a transaction.
- Added a per-wallet stake cap on LP staking (previously only PHAND staking was capped).
- Launched an integrated dApp update: Swap, Stake, and Add Liquidity are now available in a single interface.
- Corrected an LP token address misconfiguration in the staking dApp frontend.
- Updated liquidity figures, holder count, and roadmap timeline to reflect actual project progress.
- Contract source code verified on Etherscan and Sourcify for both the token and staking contracts.

Version 1.0 (October 9, 2025)

Initial release of the PaperHands (\$PHANDS) whitepaper.

1. Executive Summary

PaperHands (\$PHANDS) is an ERC-20 token launched on October 7, 2025, at address 0x11157Da1fC6dCfd58b50ed79082183b2c6176245 on Ethereum Mainnet. Redefining the “paper hands” meme, \$PHANDS offers staking (20% APY base rate, 30-day lockup on principal, rewards claimable at any time), 5% referral bonuses on user activity, and liquidity incentives for early providers in Uniswap V2 and Balancer PHANDS/WETH pools.

As of July 2026, combined liquidity across both pools stands at approximately \$346 (Uniswap V2: ~\$168.86; Balancer: ~\$177.53), with 10 token holders. The project has completed a security review cycle on its smart contracts (see Section 4) and redeployed a hardened staking contract. Ownership renounce of the token contract remains intentionally deferred until initial community-building milestones (first 10 core members plus their referral chains) are met, so that planned airdrop and referral distributions can still be carried out. With an initial 1,000,000 \$PHANDS supply and anti-whale limits (2% max wallet, 1% max tx), the project aims to grow adoption responsibly, prioritizing contract safety and transparency over speed.

Note: liquidity and holder figures are a snapshot as of the publication date and will change over time. Refer to the live Uniswap/Balancer pool pages and Etherscan for current figures.

2. Problem Statement and Market Overview

Memecoins and DeFi face challenges such as whale dominance, premature selling, insufficient retail incentives, and — increasingly — unaudited or hastily-deployed smart contracts that put user funds at risk. \$PHANDS targets retail traders and meme enthusiasts seeking fair access and a project that treats contract security as a first-class concern rather than an afterthought.

Competitor	Strength	Weakness	\$PHANDS Approach
SHIB	Viral community	High inflation	Fixed initial 1M supply, transparent minting log
DOGE	Brand recognition	No staking	30-day principal lockup, on-chain reward accounting
PEPE	Low entry	Whale control	Anti-whale limits (2% max wallet)

3. Solution

\$PHANDS combines staking incentives, referral rewards, and liquidity-provider bonuses with a security-first approach to contract development:

- **Staking:** 20% base APY (dynamically reduced as the staked ratio grows, to keep rewards sustainable), 30-day lockup on staked principal, with accrued rewards claimable at any time regardless of lockup status.
- **Referrals:** 5% bonus on qualifying user activity, minted as new tokens under a capped, logged process.
- **Liquidity incentives:** bonus terms for early liquidity providers on the Uniswap V2 and Balancer PHANDS/WETH pools.
- **Unified dApp:** Swap, Stake, and Add Liquidity are now available from a single interface (phands-staking-dapp.vercel.app), reducing the risk of users interacting with incorrect contract addresses.
- **Anti-whale mechanics:** 1% max transaction, 2% max wallet, to reduce concentration risk.

4. Technology

\$PHANDS is a Solidity ^0.8.20 ERC-20 token using OpenZeppelin libraries (ERC20, ERC20Pausable, Ownable), deployed at 0x11157Da1fC6dCfd58b50ed79082183b2c6176245 and verified on Etherscan.

4.1 Staking Contract — Security Review and Redeployment

The original staking contract was reviewed internally prior to wider promotion. Two issues were identified and corrected in a redeployed contract at

0xc84d7d602bB3880a1f5a83335c0C61c9C3e9c668 (verified on Etherscan and Sourcify):

- The original emergencyWithdraw function had no upper bound and could in principle have withdrawn user-staked funds, not just the undistributed reward pool. The corrected version restricts withdrawals to funds beyond the total staked amount.
- Unstaking one token type (PHAND or LP) could zero out unclaimed rewards accrued on the other type due to shared reward-balance accounting. Rewards are now tracked in fully separate balances per stake type.

Additional improvements in the redeployed contract: partial unstaking (in addition to full withdrawal), independent auto-claim toggles for PHAND and LP stakes, a public pendingRewards() view function, an LP staking wallet cap (mirroring the existing PHAND cap), and gas-optimized custom errors. The 30-day lockup applies to staked principal only; accrued rewards can be claimed at any time via claimRewards(), independent of the lockup.

A formal third-party audit (e.g. CertiK) is intended for a later phase (see Roadmap, Section 7); in the interim, both contracts are open-source and verified, and the fixes above were validated on a test network before mainnet redeployment.

4.2 Key Functions (Token Contract)

- Transfers with 1% max transaction (10,000 PHAND) and 2% max wallet (except owner).
- Referral system: setReferrer() and claimReferralBonus() (5% bonus, owner-triggered, capped per transaction).
- Airdrop: batch distribution, max 20 recipients per call.
- Pause/unpause for emergency control (subject to eventual renounce — see Section 5 and Section 7).

4.3 Liquidity Pools (as of July 2026)

Venue	Pair	Approx. Value	Notes
Uniswap V2	PHANDS/WETH	\$168.86	18.35 LP tokens outstanding; stakeable in the dApp
Balancer	PHANDS/WETH (80/20)	\$177.53	~8.07k PHANDS / 0.0052 WETH

Target: continued organic growth of both pools; no fixed liquidity target or timeline is promised, given the project's early stage.

5. Tokenomics

- **Token Symbol:** \$PHANDS
- **Total Supply:** Initial 1,000,000 \$PHANDS (18 decimals), with owner-controlled minting reserved for airdrops and referral bonuses only.
- **Distribution:** Community/Staking/Airdrops 50% (500,000); Liquidity Pools 20% (200,000); Team/Reserve 25% (250,000, 24-month vesting); Ecosystem/Marketing 5% (50,000).
- **Holders:** 10 as of July 2026, including the project's primary treasury wallet.
- **Ownership renounce:** intentionally deferred. The plan is to complete the initial community-building phase — onboarding the first 10 core members and processing their referral chains — before renouncing minting/pause control on the token contract, so that these distributions can still be carried out. No fixed calendar date is set; see Roadmap, Section 7.
- **Mechanisms:** anti-whale limits (1% transaction, 2% wallet); no built-in burn.

6. Team

The PaperHands project is led by a solo founder/developer under the PaperHands Development Team, focused on hands-on smart contract development and a security-conscious approach to DeFi mechanics.

7. Roadmap

Phase	Timeline	Milestones
Phase 1: Launch	October 2025 (completed)	Token deployed; initial Uniswap/Balancer pools created; original staking dApp live.
Phase 2: Community Foundation	Q3–Q4 2026	Onboard first 10 core holders and process referral chains; security-hardened staking contract live.
Phase 3: Stabilization & Renounce	Q1–Q2 2027	Ownership renounce on the token contract once Phase 2 distributions are complete; third-party audits.
Phase 4: Expansion	H2 2027+	DeFi integrations; broader holder base; potential governance exploration.

8. Risks and Mitigation

- **Market Risk:** memecoin volatility — partially offset by staking rewards, not a substitute for price stability.
- **Technical Risk:** smart contract bugs. An internal review of the staking contract identified and fixed two issues prior to wider promotion (see Section 4.1); both contracts are open-source and verified. A formal third-party audit is planned for Phase 3 (Section 7), not yet completed.
- **Centralization Risk:** the token owner currently retains minting and pause capability, and the staking contract owner retains reward-pool deposit/withdrawal capability. This is disclosed openly; renounce is planned per the roadmap above, not immediately, so that planned distributions can be completed first.
- **Regulatory Risk:** EU MiCA compliance — transparent design, legal consultation ongoing.
- **Adoption Risk:** slow growth — addressed via referrals and direct community-building rather than paid promotion at this stage.
- **Inflation Risk:** owner-controlled minting for referrals/airdrops only, logged and capped; to be fully eliminated via renounce once Phase 2 is complete.
